Hot Failover for Backup

PREMIER WIRELESS™

HAVE YOU EVER LOST CONNECTIVITY WHEN YOU NEEDED IT MOST?

Never miss a beat; our hot failover technology can help you create an unbreakable VPN connection that is more resilient and reliable than a single cellular link.

A robust internet connection is not just a 'nice to have – it is critical to ensure all your sites are secure, protected, accessible, and always connected. Our **Hot Failover** solution manages multiple redundant connections to keep VPNs and VoIP deployments up and running at all times; providing peace of mind that your critical communication systems, including phones and CCTV, are always secure and operational.

Hot Failover provides numerous benefits, including Increased system availability, reduced data loss, improved system performance, and simplified disaster recovery. With this hot failover solution, if the primary system fails, the secondary cellular system can take over without interruption, ensuring your network remains available, which is crucial for applications that require continuous availability and minimizes any loss of data. It can also improve day-to-day network performance by allowing the load to be balanced over both networks. Hot failover also simplifies disaster recovery because it provides redundancy, reducing the time and effort to recover from a failure.
